## **1 Introduction**

## **2 What Is a Gamer?**

To first look at whether game developers should be responsible for the fragmentation of gamer identities we must first look at the definition of a "Gamer" this sort of definition is central to studying video game culture [1]. Many studies disprove the misconception that the "Typical Gamer" is a white, heterosexual, male teen [2]. Gender is also a huge area of study on gamer identities where studies are trying to find multiple ways to include girl gamers where the media accept that "boys" and "girls" have different play styles. In turn this should supposedly make video game culture more accessible to female gamers.[3]

### 3 Broadening Diversity

Articles have acknowledged that since the Nintendo Wii's release gaming has been brought to a larger audience [4]. Which may prove true William's prediction that the media covering a more diverse gaming audience would create a more diverse gaming audience. [5] The expansion of broader types of gaming is not done for the benefit of the community it is used mainly for marketers and developers to make more money.[6] Which is counterintuitive as "minority" players such as women, males of many ages, "non-gamers" and those of a different racial and cultural background which represent a majority of the population.[7] Due to what the common demographic for games is, a large quantity of research centred on players is male centred.[7]

### 4 Game Developers

One of the sources of gamers fragmented culture is the game developers themselves for example a games journalist had a game played for her because the industry PR rep did not believe she had the ability to play the game that he was advertising saying, "I think I better play it for you" [8]. A point that is consistently raised by developers and those in defence of developers is that the games industry is driven by the market for them.[7] The author thinks that a reason for the industry having a hard time creating games for women is that they do not employ a large number of women in industry according to figures from Skillset 2009 women only represented 4% of the games industry workforce.[9] This looks at developmental roles of women in industry, which deal with creative and developmental aspect of game development. This also influences who the target market will be of the games that they work on.[10] Which may go to show why not many games are aimed towards women or girls. Within the industry it has been shown to be a "boys-only" ethos such as when game producer *Nour Polloni* wanted a female character to wear baggy pants but the all-male creative team wanted to dress her in a string bikini.

The author thinks that this is one of the reasons that women are not being heard within industry because their ideas are silenced, thus they do not want to nor can advance in industry.

## 4.1 Statistics

Table 1 of [10] shows the percentage of men and women in each job role within the games industry. Even though the Entertainment Software Association(ESA) reported that 38% of gamers are women, this goes against the conception that the games industry follows the market[7]. A study created by AOL on casual gamers found that women over 40 spent a large quantity of time playing casual games.[11] Even with these statistics many in the games industry do not consider "Casual Gamers" to be real gamers. While other companies have chosen to ignore "minority" gamers, Nintendo has chosen to do the opposite and create adverts that show a variety of players such as women, girls, adults and baby boomers playing with each other, rather than showing off fancy graphics.[12]
